FAO/OIE Reference Laboratory Contract Report^{1,2}
July-September 2010

Foot-and-Mouth Disease

¹N.B. The content of this report is the property of WRLFMD, IAH-Pirbright. For presentation, publication or any other public use, please contact Dr. Jef Hammond, IAH-Pirbright, jef.hammond@bbsrc.ac.uk.

²Copies of all the individual reports cited herein can be obtained from Dr. Jef Hammond, IAH-Pirbright, jef.hammond@bbsrc.ac.uk.

Summary

ASIA

Afghanistan, Iran, Pakistan and Turkey

The O-PanAsia-2 and A-Iran-05 lineages continue to dominate in these countries. The PanAsia-2 lineage has been subdivided into six sub-lineages named BAL-09, YAZ-09, FAR-09, SAN-09, ANT-10 and PUN-10. During 2010, the ANT-10 sub-lineage has become dominant in Iran and Turkey. This sub-lineage has been detected in Pakistan, but not yet in Afghanistan.

P.R. China

Three further outbreaks of FMDV type O occurred in July and August 2010, bringing the total to 17:

27/07/2010: Chengdong village, Shan Dan, Zhang Ye, Gansu (pigs);

23/08/2010: Huangzangsi, Qilian, Habei Prefecture, Qinghai (cattle);

23/08/2010: Animal health inspection station of Er Ba Tai, Ku Che, Akesu, Xinjiang (cattle).

No information concerning the genotyping of viruses from these outbreaks is yet available.

Taiwan POC

As the result of a routine serological survey using an NSP Elisa, 8 pigs in a herd of 1428, at Sinwu Township, T'ao-Yuan (10/08/2010) were found to be positive for FMDV antibodies. The pigs were all clinically healthy and attempts at virus isolation and RT-PCR were all unsuccessful.

Japan

The last (292nd) outbreak of FMD occurred on 04/07/2010 at Miyazaki city 3, Miyazaki. One of 16 cattle showed clinical signs and was confirmed as having type O. No outbreaks have occurred since.

Mongolia

Two new outbreaks of FMDV type O occurred on 26/08/2010 at Sukhbaatar soum, Baga-3 Gun jalga, Sukhbaatar in sheep and goats and on 02/09/2010 at Teeliin bulag, Tsagaanchuluut baga, Chuluunhoroot soum, Dornod in cattle. All outbreaks this year (n=5) have been in the east of the country.

Russian Federation

Two outbreaks of FMDV type O occurred on 05/07/2010 at Abagaytuy, Zabajkal'skij Kray and on 26/08/2010 at Village Makarovo, Shilkinsky, Zabajkal'skij Kray. Both outbreaks involved cattle and pigs. Complete VP1 sequences of viruses from both outbreaks were submitted to the WRLFMD by ARRIAH. The sequences indicated that both viruses belonged to the SEA topotype, Mya-98 lineage, however, the virus from the July 2010 outbreak was most closely related to viruses from Hong Kong SAR, Republic of Korea and Japan, while the virus from the August outbreak was closely related to a virus sequence from recent outbreaks in Mongolia, indicating different origins for the two outbreaks (see detailed analysis below).

AFRICA

Botswana

An outbreak of FMD caused by the SAT 2 serotype occurred in 200/349 cattle at Lesoma, Chobe, Kasane between 26/07/2010 and 20/09/2010. Lesoma is a village located in the north-east of Botswana close to the borders with Zimbabwe and Namibia. Samples have been typed at the Botswana Vaccine Institute (OIE's Reference Laboratory) and genotyping results are awaited.

Namibia

An outbreak of FMD which was reported previously (09/04/2010) on Impalila island, Kabbe constituency, Caprivi was confirmed by the OVI as being caused by SAT 1. It is suspected that transmission of FMDV occurred from wild African buffalo (*Syncerus caffer*) resident in the area.

Mozambique

Four outbreaks of FMD were reported in cattle in the south of the country (Gaza province) on 24/09/2010. Samples were submitted to the OVI and results are awaited. It is thought that FMD originated from infected cattle moved from Chicualacuala District (close to the Zimbabwe border) to Bilene and Chokwe Districts (which are located further south in Mozambique).

South Africa

An outbreak of FMD occurred in 19/80 cattle on 06/08/2010 at Malati, Ba-Phalaborwa, Limpopo in the FMD Protection Zone adjacent to the Kruger National Park. No typing results have yet been reported by the OVI.

Zimbabwe

The FMD situation following four outbreaks of SAT 2 between May and June, at Mangwe, Matebeleland South, is unclear. Animals are suspected to have been in contact with previously infected animals during a previous outbreak that occurred in September 2009 at a feedlot in the area.

SOUTH AMERICA

Venezuela

Panaftosa reported the presence of FMD type A in Venezuela in July 2010.

Uncharacterised FMD viruses

A number of other outbreaks have occurred where samples have not been sent to the WRLFMD. It is probable that the countries involved have performed their own genetic characterisation; however, through the OIE/FAO laboratory network we would also like to encourage the submission of samples (or complete VP1 sequences) to the WRLFMD.

An up-to-date list and reports of FMD viruses characterised by sequencing can be found at the following website: http://www.wrlfmd.org/fmd_genotyping/2010.htm.

WRLFMD vaccine recommendations have not changed from the previous report (Annex 3).

Results from samples received at WRLFMD (status of samples being tested) are shown in Table 1 and a complete list of clinical sample diagnostics made by the WRLFMD between July and September 2010 is shown in Annex 1 Table A. A record of all samples received to IAH-Pirbright (July-September 2010) is shown in Annex 1 Table B.

Table 1: Status of sequencing of samples received by the WRLFMD from July-September 2010.

Batch	Date Recd.	Country	Serotype(s)	No. of isolates	Status

Vaccine matching

Fourteen FMDV type O isolates (See Table C, Type O for details) from Ecuador, Iran, Pakistan and United Arab Emirates (UAE) collected in 2009 and 2010 were analysed antigenically by the two dimensional virus neutralisation test (2dmVNT) and/or LPBE. All isolates from Iran, Pakistan and UAE were matched with O Manisa, O IND R2/75, O TAW 98 and O BFS by 2dmVNT or LPBE except one isolate, respectively. Four isolates from Pakistan and UAE also showed close match with O Campos, O IND 53/79 and O TAI 189/87 by VNT or LPBE. Two isolates from Ecuador showed no match with any of the testing vaccine strains. Five isolates from IRAN were antigenically close to O 4174 by LPBE (Table C).

Nine FMDV type A viruses (see table C, Type A for details) from Iran, Nigeria, Pakistan and Tanzania collected in 2009 and 2010 were analysed for antigenic relationships with various vaccine strains by 2dmVNT and/or LPBE. All four isolates from Iran showed a close match with A TUR 06 but not with all other tested vaccine strains except one which matched with A IND 17/82. The isolate from Nigeria was antigenically close to A Eri 98, A TUR 06 and A IND 17/82 but not to all other vaccine strains. Two isolates from Pakistan were close match with A22 Irg and A SAU 41/91 strains. Both isolates from Tanzania showed a close match with Eri 98 but only one matched with A22 Irg, A SAU 41/91 and A TUR 06 (Table C).

Two FMDV type SAT2 virus (see table C, Type SAT2 for details) from Kenya and Tanzania collected in 2009 were antigenically matched with SAT2 3218 strain, but only one isolate was a close match with SAT2 ZIM vaccine strain (Table C).

Annex 1.

TOTAL : 154

**

the majority of samples from Afghanistan were supplied in RNA later for PCR analysis and virus serotypes were defined by sequencing

FMD(V)
GD

foot-and-mouth disease (virus)
genome detected

a

FMDV serotype O identified by unvalidated type-specific RT-PCR assay

b

FMDV serotype A identified by unvalidated type-specific RT-PCR assay

c

FMDV serotypes O and A identified by unvalidated type-specific RT-PCR assay

VI/ELISA

FMDV serotype identified following virus isolation in cell culture and antigen ELISA
reverse transcription polymerase chain reaction on epithelial suspension for FMD viral genome

RT-PCR

no foot-and-mouth disease, swine vesicular disease or vesicular stomatitis virus detected

NVD

TABLE B: Summary of samples collected and received to IAH-Pirbright (July-September 2010)

Country	No. of samples	Virus isolation in cell culture/ELISA							RT-PCR for FMD (or SVD) virus (where appropriate)		
		FMD virus serotypes			NVD	NT			Positive	Negative	
		O	A	C			SAT 1	SAT 2	SAT 3	Asia 1	
AFGHANISTAN**	81	-	-	-	-	-	-	-	4	77	73
IRAN	15	11	3	-	-	-	-	-	1	-	15
PAKISTAN***	21	10	1	-	-	-	-	-	11	-	19
SENEGAL	4	-	-	-	-	-	-	-	4	-	4
TURKEY	33	20	3	-	-	-	-	-	10	-	30
TOTAL	154	41	7	-	-	-	-	-	30	77	137
											17

** all but 4 samples from Afghanistan were supplied in RNA later for PCR analysis

*** one sample from Pakistan contained a mixture of type O and A FMDVs

VI/ELISA FMD (or SVD) virus serotype identified following virus isolation in cell culture and antigen detection ELISA

FMD foot-and-mouth disease

SVD swine vesicular disease

NVD no FMD, SVD or vesicular stomatitis virus detected

NT not tested

RT-PCR reverse transcription polymerase chain reaction for FMD (or SVD) viral genome

TABLE C: Antigenic characterisation of FMD field isolates by matching with vaccine strains by VNT and/or LPBE – r1 value data from 1st July to 30th September 2010**Type O:**

Type SAT2:

r ₁ values by 2dmVNT for type SAT2 virus --WRL, Pirbright		
Vaccine strains	SAT2 3218	SAT2 ZIM
WRL ref for virus	VNT	VNT
Ken 122/2009	0.41	0.42
Tan 43/2009	0.38	0.19

Interpretation of r₁ valuesIn the case of VNT:

r₁ = ≥ 0.3. Suggests that there is a close relationship between field isolate and vaccine strain. A potent vaccine containing the vaccine strain is likely to confer protection.

r₁ = < 0.3. Suggests that the field isolate is so different from the vaccine strain that the vaccine is unlikely to protect

In the case of LPB ELISA:

r₁ = 0.4-1.0. Suggests that there is a close relationship between field isolate and vaccine strain. A potent vaccine containing the vaccine strain is likely to confer protection.

r₁ = 0.2-0.39, Suggests that the field isolate is antigenically related to the vaccine strain. The vaccine strain might be suitable for use if no closer match can be found provided that a potent vaccine is used and animals are preferably immunised more than once.

r₁ = <0.2. Suggests that the field isolate is so different from the vaccine strain that the vaccine is unlikely to protect

Annex 3. RECOMMENDATIONS FROM WRLFMD ON FMD VIRUS STRAINS TO BE INCLUDED IN FMDV ANTIGEN BANKS – September 2010

High Priority

O Manisa (*covers panasian topotype*)
O BFS or Campos
A24 Cruzeiro
Asia 1 Shamir
A Iran-05
A22 Iraq
SAT 2 Saudi Arabia (*or equivalent*)

(not in order of importance)

Medium Priority

A Eritrea
A Iran '96
SAT 2 Zimbabwe
A Iran 87 or A Saudi Arabia 23/86 (*or equivalent*)
SAT 1 South Africa
A Malaysia 97 (*or Thai equivalent such as A/NPT/TAI/86*)
A Argentina 2001
O Taiwan 97 (*pig-adapted strain or Philippine equivalent*)
A Iran '99

(not in order of importance)

Low Priority

A15 Bangkok related strain
A87 Argentina related strain
C Noville
SAT 2 Kenya
SAT 1 Kenya
SAT 3 Zimbabwe
A Kenya

(not in order of importance)
